DA INVESTORS

We are building a global network of networks and Daml is the interface between connected applications and infrastructure

The Business Problem: Legacy Transaction Technology

What do legacy systems and outdated business processes all have in common across financial transactions?

Multi-party workflows with increasing internal and external sharing needs.

Complex trust requirements between systems requiring no unknown participants in the system.

Burdensome privacy and regulatory requirements around transaction and participant data.

Results in heavy reconciliation and inaccurate data sharing

What does this mean for many organizations?

Manual reconciliation & inaccurate data sharing leads to:

Large overhead in building and maintaining systems

Expensive data breaches

Slow innovation that is non-existent in some cases

Hits to trust and reputation

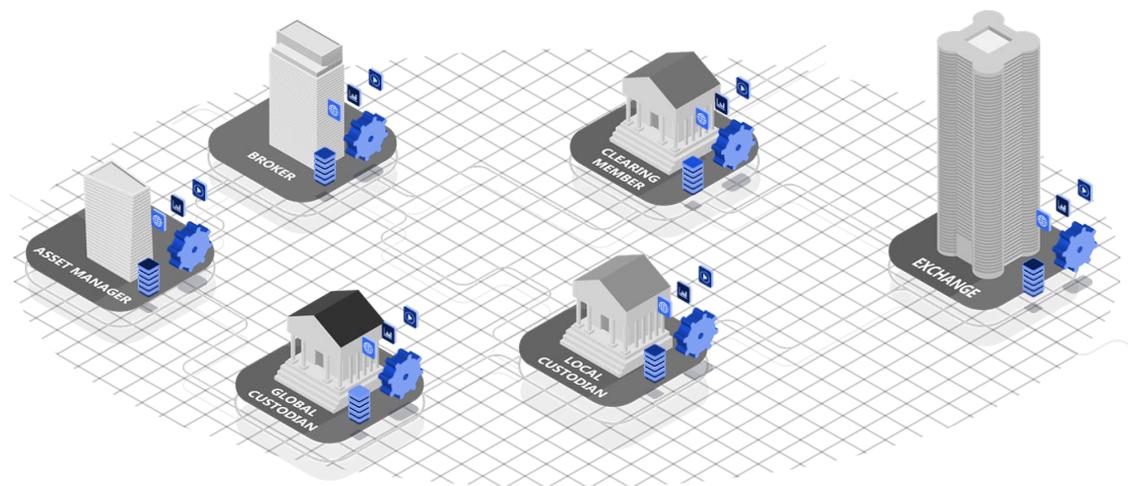

Organizations are aware of these problems, but are stunting growth via decision paralysis

- **Old and new problems to solve** and companies are aware and trying to do something about it, but they are paralyzed
- **Reconciliation and operational inefficiencies** continue to haunt financial transactions involving multiple parties capitalizing on new regulations
- **Competitive threats from nimble startups** and a rapidly evolving ecosystem of asset classes and products in market threaten the status quo of the larger organizations

What if companies could address old problems—without ripping out legacy infrastructure—and still innovate toward the future of decentralized economic networks?

Enterprise blockchains can enable large transactions across multiple parties while ensuring privacy of participants and transactions. **Enter Daml.**

Fix reconciliation problems

Address existing problems and get ready for the future without an expensive reset

Reduce cost and risk

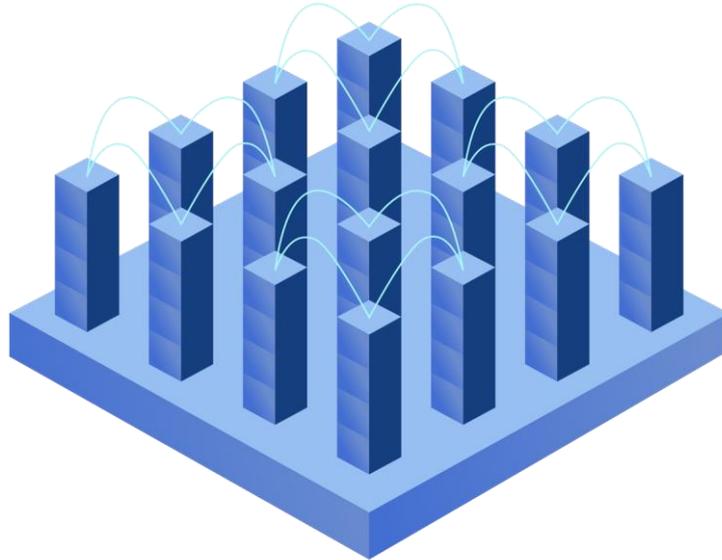

Reduce delays in transactions while reducing counterparty risk and spend on fixing issues or regulatory compliance

Focus on innovation

Spend more time and resources in delivering new innovative products and services and growing your economic network

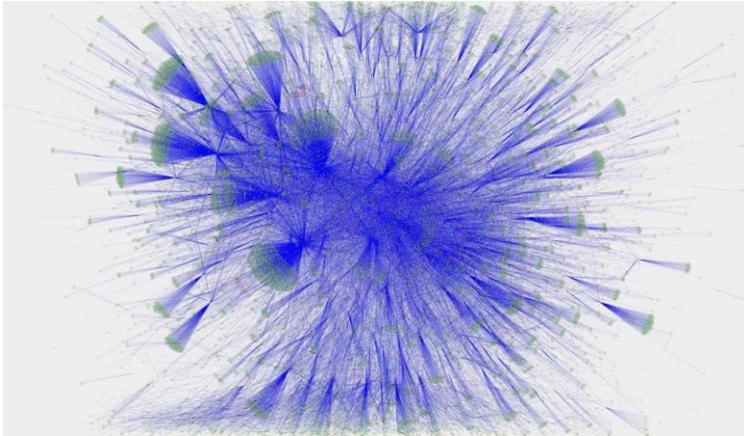

Our Vision: The Global Economic Network

A seamless layer of infrastructure that connects networks in order to compose frictionless multi-party applications while retaining privacy guarantees.

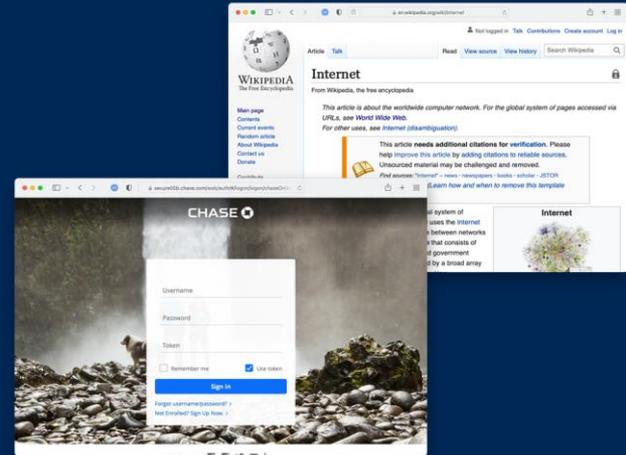

Digital Asset

The Internet is an incredibly complex network-of-networks.

But users can browse from public Web pages to private banking information seamlessly, without worrying about the underlying infrastructure.

THE SOLUTION

A platform that lets you forge seamless connectivity across business boundaries.

Daml is the leading platform for building and running multi-party applications. Companies can create solutions that transform disparate silos into synchronized networks, eradicating latency and errors by guaranteeing consistent, shared, and trusted data and workflows.

THE SOLUTION

Daml is the leading platform for building and running sophisticated, multi-party applications.

Daml contains two core innovations: the Daml Language and Canton.

The Daml Language

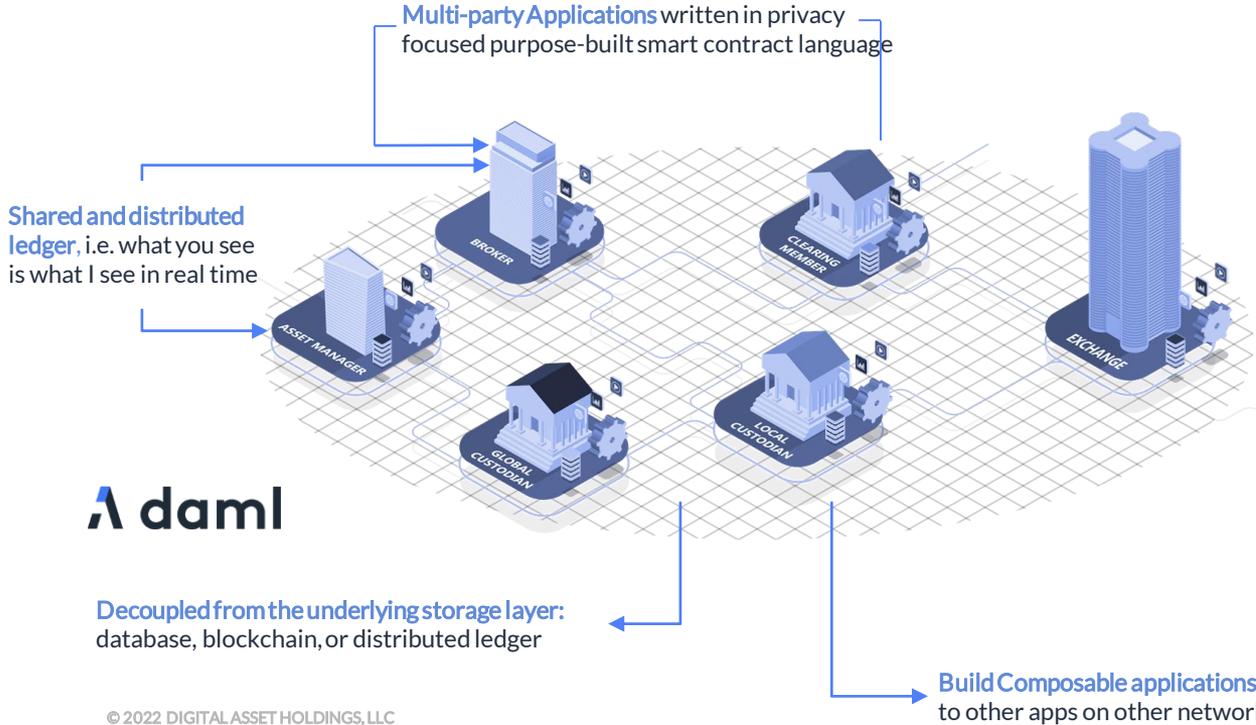

Daml contains a smart contract language and tooling that defines the schema, semantics, and execution of transactions between distributed parties.

The Canton Ledger

A privacy-enabled distributed ledger that is enhanced when deployed with complementary blockchains and provides secure synchronization between multiple parties on a wide range of technologies.

Accelerate business transformation with **Daml** and **Canton**

Write multi-party applications in Daml ensuring privacy and transparency for only authorized parties

Create a shared virtual ledger Canton simplifies secure data sharing between organizations while preserving privacy and authorization

Leverage existing infrastructure No need to retire your existing infrastructure to run decentralized and distributed apps

Grow your Economic Network Scale your network and get future-ready by adding new participants and letting others create new decentralized applications

Canton domains can be centralized or decentralized to suit application needs

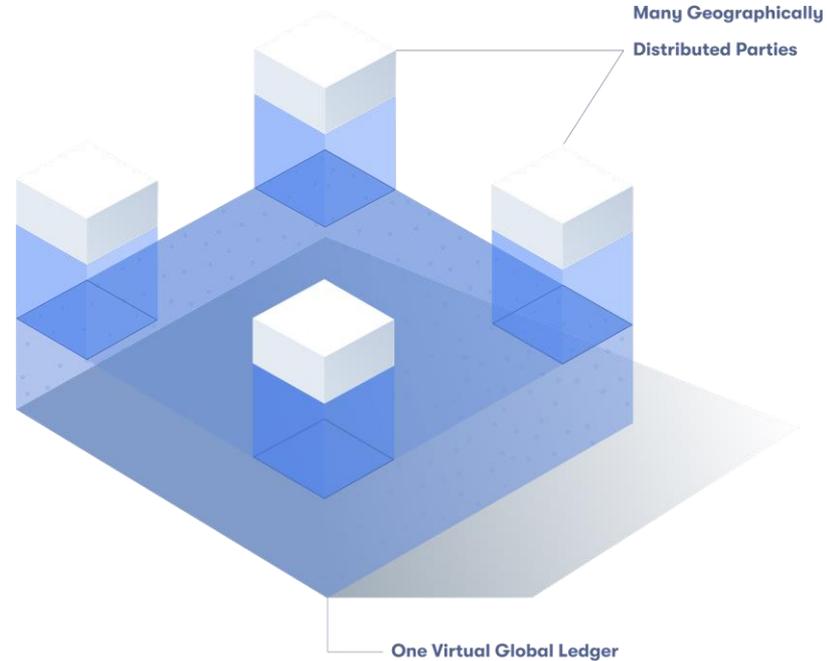

Canton nodes synchronize through domains. Transactions are encrypted so the domain operator never sees confidential data.

Canton domains can run backed by a relational database or a blockchain if decentralization is required.

DATABASES			
BLOCKCHAINS			

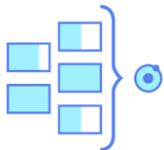

PUBLIC CHAINS WILL NOT GET US THERE

None of the most popular chains support the necessary privacy to run commercially sensitive enterprise transactions or even allow for a heterogeneous application ecosystem.

Name	Price	24h %	7d %	Market Cap
☆  Bitcoin 1 BTC	\$41,822.83	▲ 0.64%	▼ 10.35%	\$792.00B
☆  Ethereum 2 ETH	\$3,111.37	▲ 0.15%	▼ 18.64%	\$370.82B
☆  Tether 3 USDT	\$1.00	▼ 0.00%	▲ 0.02%	\$78.29B
☆  BNB 4 BNB	\$449.43	▲ 3.70%	▼ 12.66%	\$74.87B

☆  XRP 8 XRP	\$0.7391	▼ 0.37%	▼ 11.48%	\$35.21B
☆  Terra 9 LUNA	\$71.50	▲ 3.41%	▼ 19.57%	\$25.56B
☆  Polkadot 10 DOT	\$23.95	▼ 1.54%	▼ 19.95%	\$23.64B
☆  Dogecoin 11 DOGE	\$0.1592	▲ 6.62%	▼ 7.09%	\$21.22B

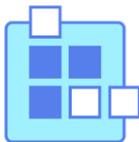

Daml is designed to offer **Secure Synchronization between parties**

DATA OWNERSHIP

Every party owns their data, located in their SoR. Data with a single owner can be modified freely.

STRONGLY PERMISSIONED

Data on the overlaps between views are only read and modified according to defined, permissioned processes.

HIGH PRIVACY

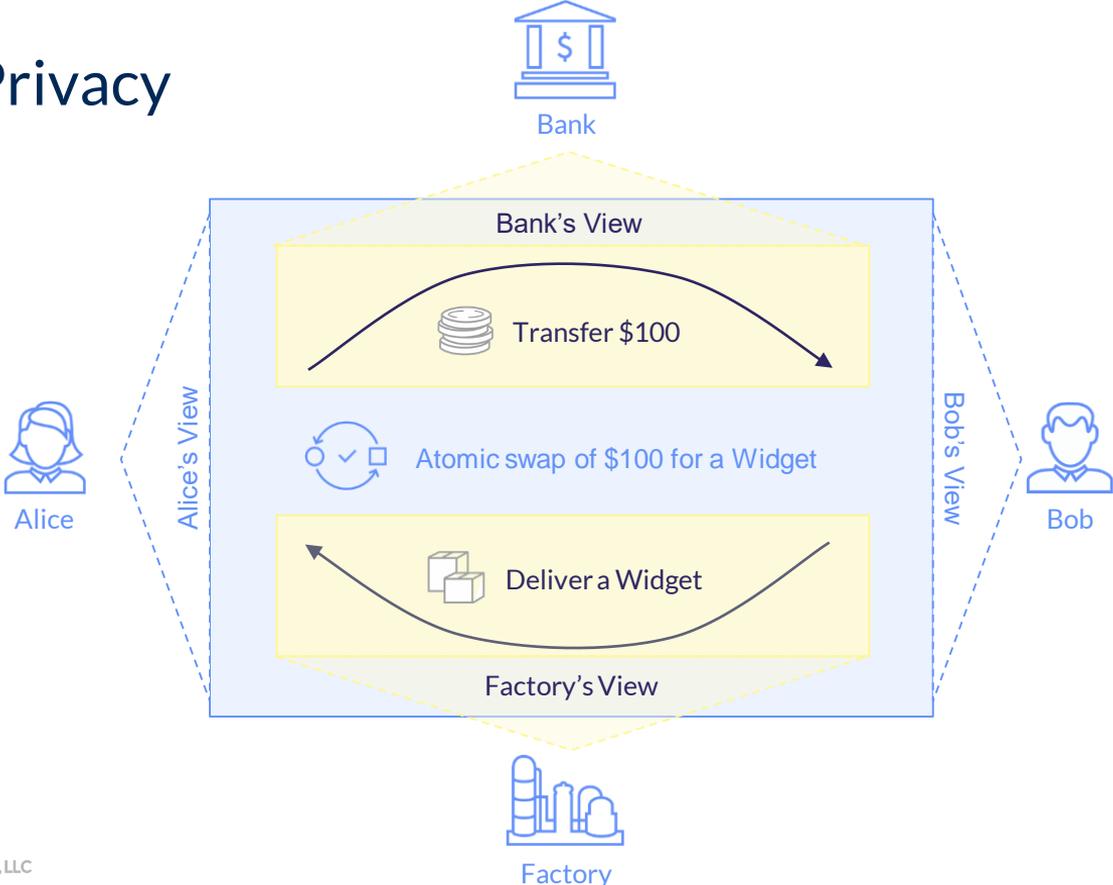

Data is shared on a strict need-to-know basis.

TRUSTLESS & FAULT-TOLERANT

Malicious or faulty parties cannot falsify another party's SoR.

Desired Privacy in DvPs

            newOwner = seller
            newAccount = sendToAccount

return (widgetOfBuyer, cashOfSeller)
```

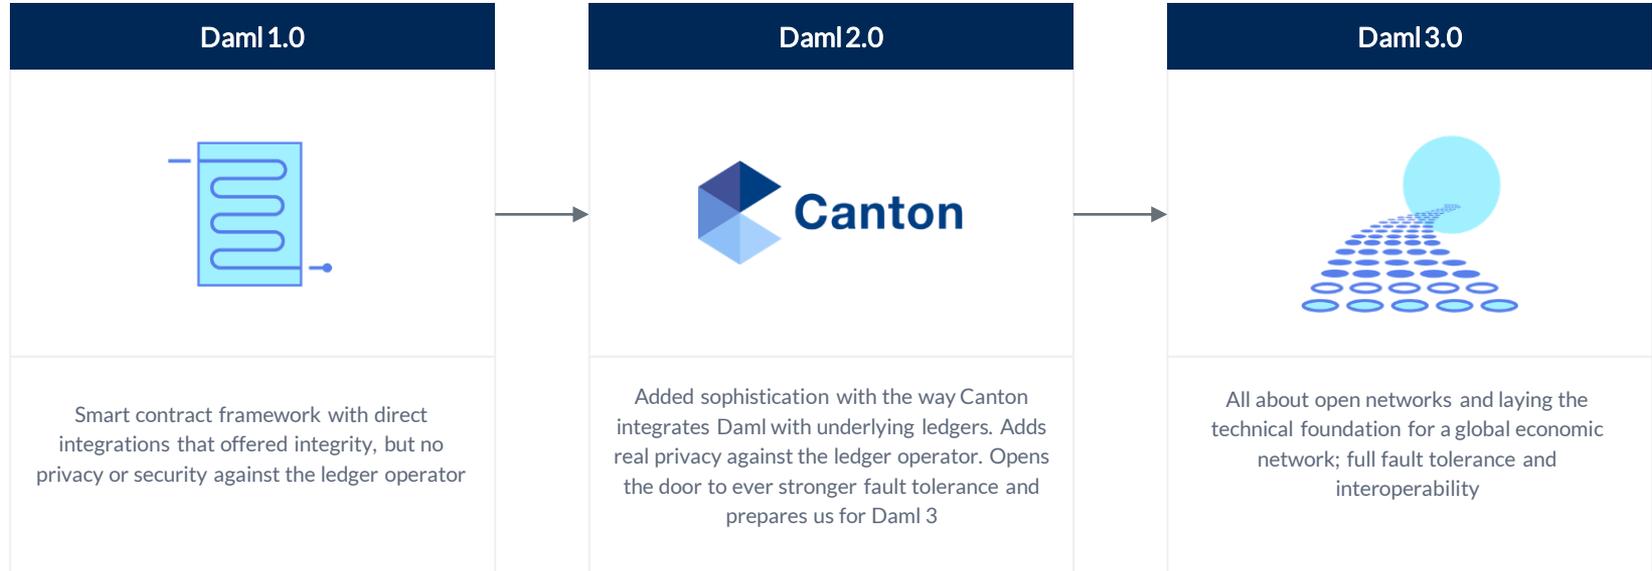

Only Canton supports sub-transaction-level privacy

Ledger	Granularity of privacy	Transactions are composable across privacy sets	Transactions preserve contract privacy	Transactions preserve historical privacy
Canton	Smart Contract	✓	✓	✓
ADLT Platform	Transaction	✗*	✗	✗
Everything else	Channel (semantic variants include zkRollups, Subnets, etc)	✗	✗	✗

**While technically possible it leaks all contracts to all transaction stakeholders*

What's next?

Daml 1.0-Daml 2.0-Daml 3.0

Daml in the real world

Use cases for Daml-driven applications

CLEARING & SETTLEMENT

Enable users to optimize data use

TOKENIZATION & ISSUANCE

Create truly smart assets

LIFECYCLE MANAGEMENT

End-to-end management, across technology infrastructures

PAYMENTS

A shared, virtual system of record

CUSTODY & SAFEKEEPING

With privacy and efficiency

SUPPLY CHAIN

Balance responsiveness and efficiency
